**STUDENT NAME: NEMULALATE NDAEDZO**

**MODULE CODE: WEDE 5020**

**GROUP: BIB1**

**SUBJECT NAME: WEB DEVELOPMENT**

### **THINGS THAT ARE CHANGED FROM PART 2 AND IMPROVED TO PART 3:**

#### **ADDING JavaScript**

Adding JavaScript to a website makes it more interactive and fun to use. It helps the page do things like move, change, or show new information without reloading. In this case, JavaScript helped create a slideshow to show different services one after another. It also let users click arrows or dots to move between the slides. Without JavaScript, the slideshow would not work and the page would look plain. By using JavaScript, the website becomes more interesting and easier for visitors to use, which helps them learn about the services in a better and more enjoyable way.

#### **IMPROVING ENQUIRY WEBSITE PAGE**

In this update, a new dropdown menu called “Enquiry Type” has been added to the form. This lets users choose what they are enquiring about, such as services, products, volunteering, or sponsorship. After the user fills out the form and clicks submit, a custom message will appear based on what they selected. This message gives more information like availability, cost, or next steps.

A small JavaScript script was also added. It checks that the form is filled in correctly and shows the right message to the user after submission. This makes the form more interactive and helps users feel like their enquiry is being taken seriously.

By doing this, the website becomes more user friendly and professional. It also helps organize enquiries better, so the company can give faster replies. For a first-year student learning web design, this shows how to use JavaScript and form elements to improve user experience.

## **UPDATES**

In the updated version of the website, the layout and design were improved to make it look more professional and modern. The theme colors white, black, and aquamarine were used throughout the site to give it a clean and luxurious feel, which matches the style of the KDB Luxurious Cars brand. The text was made easier to read by using better font sizes and spacing, and the background image was kept, but a soft dark overlay was added behind the text so that it stands out more clearly. The navigation menu was improved to look cleaner and work better on any device, making it easier for visitors to find what they need.

### **Improving About Us website page**

The Porsche image on the page was also styled better, with rounded corners and placed nicely next to the paragraph, which makes the layout more attractive. These changes help the business by giving a strong first impression, building trust, and making it easier for visitors to use the website, especially being able to work perfectly in any device. A better looking and easier to use site means more people will stay longer, read more about the services, and possibly book a car, which is good for the growth of the company.

### **Adding more pictures**

Adding more pictures to the website makes it more attractive and engaging for visitors. When people visit a car rental website like KDB Luxurious Cars, they want to see what the cars actually look like before they decide to book. High-quality images help to show off the beauty, luxury, and details of the vehicles, which builds trust and interest. Compared to a website with fewer pictures like in part 2, a site with more images gives the customer a better idea of what they can expect. It helps them imagine themselves in the car, which can influence their decision to rent. Pictures also make the website look more professional and well designed, which makes the business look more serious and reliable. On the

business side, having more visual content can increase the time visitors spend on the site, improve the chances of them contacting the company, and even lead to more bookings. Overall, adding more images improves the user experience and can help the company grow by attracting more customers.

Adding more CSS to a website makes it look better and easier to use. CSS helps you change colors, fonts, spacing, and layout so your site looks clean and professional. This makes people enjoy using your website and helps them find what they need quickly. Adding a logo is also important because it shows your brand and helps people remember your website. A good logo can make your site look more trustworthy and unique. Together, CSS and a logo help create a strong first impression.
